

«Environmental Conservation: Playing out part, making a difference»

Humanity is threatened by such environmental hazards: global warming, climate change, water and air pollution and others.

I am worried about water pollution. Clean drinking water is becoming an important resource. People are fighting for it. Industrial development continues to pollute rivers and oceans with toxic substances. It is difficult to find rivers with clean water.

If people continue to move forward in such a detrimental way for the future, there will be no future.

We must begin with ourselves and our families. For example, my family is always sorting garbage. We often take part in cleaning the banks of our Bystrytsia River. We also don't leave garbage on the riverbanks.

If everyone does these simple things the result will be quickly visible.
